

ADR-0001 — Single repository, single deployable backend

ACCEPTED Date: 2026-09-01 · Deciders: Nicolà Widmer

Context

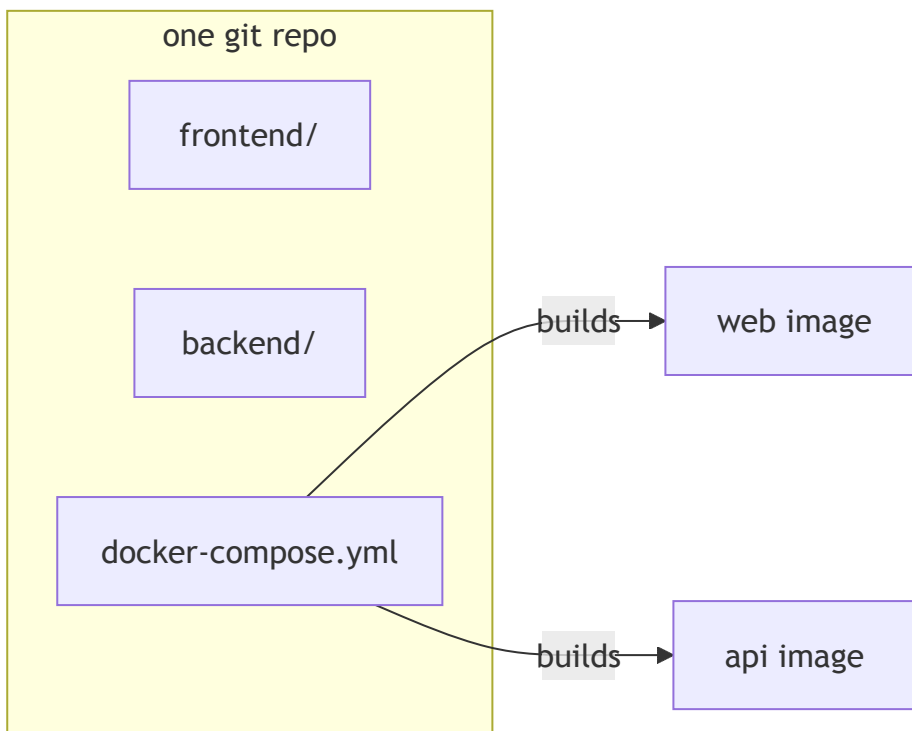

One developer, one deadline. Frontend and backend usually change together, and the system must start with `docker compose up`.

Options

1. **Monorepo, one backend process**
2. Polyrepo — separate frontend and backend repos
3. Split the backend into several services now

Decision

Option 1.

A change touching API and UI is one commit. Module boundaries (ADR-0002) keep a later split possible.

Consequences

- Good: one checkout, one build, atomic API + UI changes.
- Bad: two toolchains in one repo.
- Bad: a monolith can get tangled — ADR-0002's boundaries prevent that.
- Rejected polyrepo: version skew, cross-repo changes.
- Rejected services: network hops and deploy overhead for no gain.
