

ADR-0006 — OpenAPI-first typed frontend client; TanStack Query for server state

ACCEPTED Date: 2026-09-01 · Deciders: Nicolà Widmer

Context

The frontend needs typed API calls plus caching and loading states. A hand-written client would be a second copy of the API contract.

Options

1. Generate **openapi.json** from the backend, generate the client from it, use TanStack Query
2. Hand-written Angular services
3. Shared types package, hand-written client
4. tRPC (rejected: not REST)

Decision

Option 1.

Both generated outputs are committed. Swagger UI is at `/api/docs`.

Consequences

- Good: the contract exists once, in the backend code.
- Good: the frontend builds without a running API.
- Good: TanStack Query removes hand-written loading/refetch code.
- Bad: two generate steps to remember; generated diffs in commits.
- Bad: the fetch client skips Angular `HttpClient` interceptors.
- Bad: OpenAPI 3.0 only (a `@nestjs/swagger` limit).
